

## Magnetic Energy Automaton Mechanical Oscillator for Multiple Uses

Gregory Spaulding

Magnetic Voltage Source, USA

### ABSTRACT

MEAMOMU is the first permanent magnets only mechanical oscillator, scalable to any size, which pump actions also produces electrical power using piezoelectric, triboelectric, conductive induction and GERTAM (Gel Electrocytes Recharged by Triboelectric Anion Membranes) for VEH valance electron harvesting. Before MEAMOMU the windup watch or automaton which was the closes to defy the second law of thermodynamics. In magnetics same polarity flux radiating material in interactive proximity can be joined in linear sequentially by steel coupled geometry between the two magnets. Magnetic flux can't penetrate Pyrolytic Carbon material, so when it is pushed onto the areas of the coupling steel that receive the far ends magnetic flux polarity the two magnets become repulsive again or thus masking the coupling steel. Automaton oscillation occurs when the coupling steel attracts the same polarity near ends magnets flux together and they having a greater attractive force than the repulsive force which continues to push the Pyrolytic Carbon shaped as a bellow onto the areas accommodating the far end same polarity flux on the football shaped steel coupler until repulsion occurs. When repulsion occurs the magnets material pulls the Pyrolytic Carbon away from the coupling steel and thus unmasking it and creating same polarity coupling attraction again. From Prof. Eric Laithwaite lectures a same polarity magnetic flux coupler for linear cylinder permanent magnets all four end polarities must integrate their flux flow into the piece of steel or the close meeting ends of same magnetic flux polarity causes repulsion. The permanent magnetic cylinders with holes drilled down the center and its holes filled to both ends with polished tempered glass and Pyrolytic Carbon rods. Mechanical oscillations occurs when the magnet attached to a balanced carriage traversable chamber, so when one side of a mating magnetic cylinder coupler is covered the oscillating magnetic cylinder pull strength pushes on the pyrolytic carbon bellow making the other section uncovered and ready for attracting the magnetic cylinder back to itself. To create a renewable power source, one needs a constant or iterative self-generating radiation that can safely harvest valance electrons and or cause autonomous mechanical oscillations.

### The two models are:

1. coupled same polarity single carriage traversing chamber with a minimum of four balanced linear interactive magnetic nodes.
2. separated but balanced dual carriage traversing chambers with a minimum of four balanced linear interactive magnetic nodes.

Continuous linear mechanical oscillator with only permanent magnets was started by Professor Eric Laithwaite and now finished by Greg Spaulding. A cylinder-shaped permanent magnetics of same polarity ends are attraction coupled together with a 304 Ferritic piece of steel of sufficient diameter and thickness, and then the coupling is severed by the insertion of another 304 Ferritic piece of steel of the same sufficient diameter and thickness, which causes ferromagnetic repulsion. I discovered from experimentation pyrolytic carbon of the same sufficient diameter and thickness as the piece of 304 Ferritic of steel but with a hollowed center pushed onto the 304 Ferritic piece of steel causes diamagnetic repulsion. From the lectures a same polarity magnetic flux coupler for linear cylinder permanent magnets all four end polarities must integrate their flux flow into the 304 Ferritic piece of steel or the close meeting ends of same magnetic flux polarity causes ferromagnetic repulsion. The permanent magnetic cylinders with holes drilled down the center and its holes filled on both ends its polished tempered aluminum glass and to 304 Ferritic steel couplers on polished 200 Austenitic steel poles.

To make the oscillations autonomous the pyrolytic carbon circular pieces are attached to a balanced carriage traversable chamber, so when one side of a mating magnetic cylinder coupler is covered the oscillating magnetic cylinder pull strength pushes on the pyrolytic carbon bellow the other section is uncovered and ready for attracting the magnetic cylinder back to itself. To create a renewable power source, one needs a constant or iterative self-generating radiation that can safely harvest valance electrons and or cause autonomous mechanical oscillations.

Permanent ferromagnetic constant non-ionized radiated flux or energy was available for development. In microgravity the Earth's magnetic field being the only factor affecting MEAMOMU local experiments proves that Bismuth and Pyrolytic Carbon are used to compress, divert and or repel magnetic flux without having to compensating for bipolar magnetic interactive flux. MEAMOMU is now a portable/stationary power source, photovoltaic being the only other, and being used in the lexicon of man for the reduction of Earth's greenhouse gasses. Magnetic energy automaton mechanical oscillator for multiple uses, uses permanent magnets' flux energy, pyrolytic diamagnetic material and ferromagnetic steel for creating automaton oscillations. The introduction of metallic and ceramic foam for vacuum tube outgassing and gravity reduction. The introduction of cylinder-shaped ferromagnetic

foamed steel geometry with emphasis on length surface area instead of square geometry.

The introduction of sodium pyrolytic carbon powder coating on vacuum tube device casing and on nylon dryer vent hose used as flux diverting bellows (using sodium silicate adhesive and high frequency coil exploding pellet) to cover the cylinder-shaped ferromagnetic foamed steel. The introduction of Seebeck harvesting using friction heating in a triboelectric cavity for P&N thermoelectric harvester. Understanding the pull strength of the capsule-shaped ceramic foamed permanent ferromagnets is dependent on four magnetic polarities coupled together to achieve absorption in steel couplers for attractive pull strength but independent of conjoined pull strength when pyrolytic bellows are pushed between flux fields and foamed ferromagnetic steel to cover the polarities of weaker flux due to distance of flux travel. Utilizing dual back-to-back copper conductive membrane switches when capsule-shaped foamed permanent ferromagnets are pushed on to them for circuit completeness of both piezoelectric and hydrogel relative mechanical motion and creating valance electron harvesting [1-18].
